Notes/Other Comments

Clinical Justification guide on next page

Clinical Justification Guide

TRU-Balance Tablet Holder

- Securely positions a tablet or Alternative Communication (AAC) device within the client's functional reach, enabling independent communication, environmental control, telehealth, navigation, and learning.
- Reduces the need to hold the device or undertake unsafe reaching, minimising awkward postures, pain, upper-limb fatigue, and the risk of dropping or damaging the device.
- Supports participation in education, employment, and community activities by providing mobile access to essential technology while keeping the client's hands available for wheelchair operation.

TRU-Balance Phone Holder

- Positions the client's phone within functional reach for emergency calls, messaging, navigation, ride-share applications, reminders, and communication with caregivers or support services.
- Supports independent phone access for clients with reduced grip, upper-limb strength, reach, or trunk control.
- Reduces unsafe reaching, manoeuvring, or attempts to hold the phone while operating the wheelchair, lowering the risk of distraction, device drops, and damage.
- Clinically indicated where reliable phone access is required for safety, communication, appointment or medication management, and independent community participation.

TRU-Balance Personal Item Hook

- Provides a secure attachment point for lightweight bags, jackets, and other compatible personal items or mobility-related aids.
- Enables the client to transport essential belongings independently while keeping their hands available for wheelchair control.
- Reduces unsafe reaching or bending, the risk of items being dropped or lost, and the likelihood of belongings interfering with wheelchair controls, posture, transfers, or mobility.

TRU-Balance Oxygen Holder

- Securely mounts the client's prescribed oxygen cylinder to the wheelchair, enabling safe transport of continuous or intermittent respiratory support.
- Maintains access to oxygen during home and community mobility without obstructing wheelchair controls or compromising seating stability.
- Reduces the risk of the cylinder falling, sustaining impact damage, becoming displaced, or being carried in an unsafe position.
- Supports community participation for clients who require oxygen away from a fixed location and reduces reliance on a caregiver to carry the cylinder.

Quantum Slotted Accessory Bracket

- Provides a secure and stable mounting point for clinically required wheelchair accessories.
- Allows accessories to be positioned consistently within the client's functional reach while accommodating individual access and equipment requirements, to maintain independence.
- Helps prevent accessory movement, detachment, or unsuitable placement that could obstruct wheelchair controls, affect posture, or compromise safe operation.

TRU-Balance Reflector Kit

- Increases the visibility of the wheelchair to motorists, cyclists, pedestrians, and other community members in low-light conditions.
- Reduces collision risk during community mobility at dusk, at night, or in poorly lit environments.
- Provides a practical, low-cost risk-reduction measure for clients who regularly travel outside the home.

TRU-Balance Cup Holder

- Provides a secure, stable, and accessible location for beverages, supporting hydration and safe fluid intake while the client is mobile.
- Enables greater independence for clients who cannot safely reach a table or carry a drink due to reduced mobility, strength, grip, or trunk control.
- Reduces the risk of spills and burns from hot drinks and helps protect the client, seating surfaces, and wheelchair electronics.
- Supports longer periods of community participation by allowing fluids to remain available without ongoing caregiver assistance.

Quantum Backup Camera

- Enables the client to identify people and obstacles behind the wheelchair before and during reversing, reducing the risk of collisions, injury, and equipment damage.
- Supports clients with limited neck or trunk rotation, reduced balance, or difficulty visually scanning behind them, allowing them to reverse while maintaining a stable seated posture and control of the wheelchair.
- Provides immediate visual feedback, supporting safer and more independent manoeuvring in confined or busy environments and reducing reliance on caregiver guidance.

Lapstacker

- Secures personal items on the client's lap during wheelchair mobility, reducing the risk of belongings slipping, falling, becoming lost, or sustaining damage.
- Enables the client to carry items without continuously holding them, keeping their hands available for safe wheelchair control.
- Reduces the need for unsafe balancing or repositioning of items while moving.
- Supports independent transport of daily items within the home and community and reduces reliance on caregivers to carry belongings.

Quantum Personal Item Pouch

- Provides immediate-access storage for frequently used personal, medical, or emergency items such as tissues, medication, a phone, keys, or a wallet.
- Positions essential belongings within practical reach for clients with reduced upper-limb function, trunk control, or mobility.
- Reduces unsafe reaching or bending and prevents loose items from interfering with posture, wheelchair controls, transfers, or mobility.
